# What is an API?

Client application

GET / POST /  
PUT / DELETE

JSON / XML

API

Server

# Data formats

**XML** – Extensible markup language

**JSON** – JavaScript Object Notation

The example of the response in JSON format on the right shows that the data is stored in **key and value pairs**.

```
GET https://api.exchangeratesapi.io/latest HTTP/1.1
```

```
{  
  "base": "EUR",  
  "date": "2018-04-08",  
  "rates": {  
    "CAD": 1.565,  
    "CHF": 1.1798,  
    "GBP": 0.87295,  
    "SEK": 10.2983,  
    "EUR": 1.092,  
    "USD": 1.2234,  
    ...  
  }  
}
```

# Reading the HTTP response

HTTP - Hypertext Transfer Protocol. Most common types of HTTP responses:

- **200 - Success. Everything is fine**
- 301 - The resource you are looking for has been moved
- 404 - Error. The URL does not exist
- 500 - There is a problem on the server side. It is probably down

# How do we connect to APIs with Alteryx?

With the help of the Download and JSON Parse tools

**Step 1.** Read the API's documentation

**Step 2.** Get a request URL

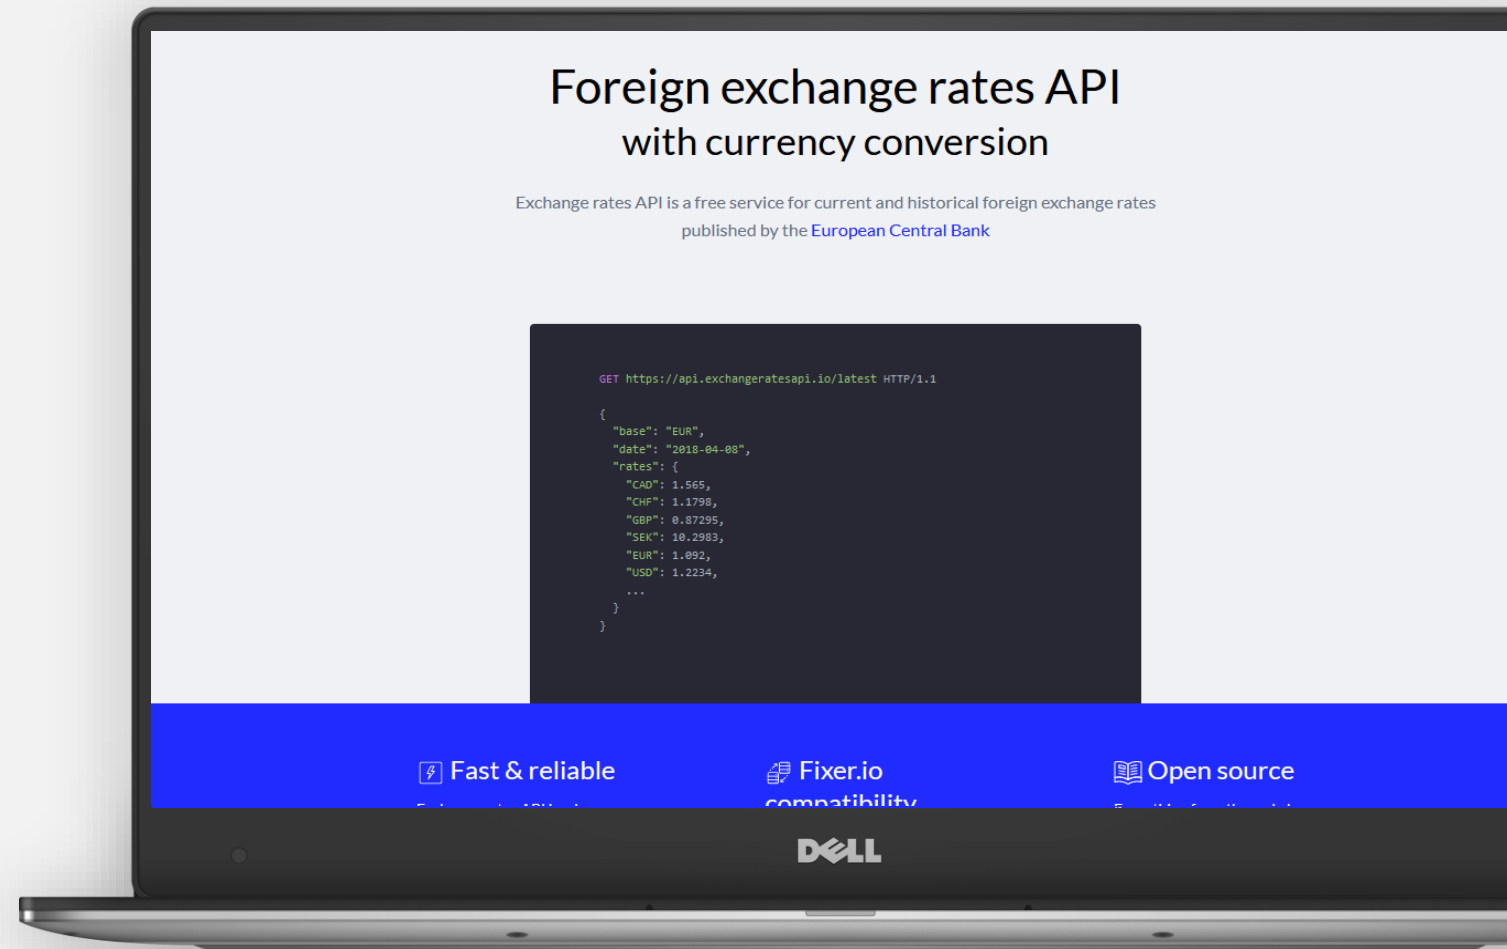

**Step 3.** Send the request to the API and download the data with the **Download tool**

**Step 4.** Break the key and value pairs into columns and rows with the **JSON Parse tool**

**Step 5.** Clean the response data, and form a table to output it or use further in the workflow
